Abstract

We propose a novel neural model that generates a POI embedding incorporating sequential and categorical information from POIs. Our model consists of a check-in module and a category module.

Motivations

- With the advent of Location-based Social Networks, users can share check-in data using their mobile devices, together with contextual information
- Successful results of considering Pre-Training models

Objectives

- Propose a POI embedding model, focusing on the contextual information
- Account sequential and categorical information
- Examine the effect of contextual information in pre-training model of POI

Proposed Method

- We propose a category-aware POI embedding model called CATAPE
- That captures both the geographical and categorical information of POIs
- Check-in Module: Visited POIs by users are geographically influenced by each other.

$$\phi_{ch}(l, S_l) = arg\ max \prod_{l \in L} [\prod_{l_w \in W(l,S_l)} p(l_w|l)] \quad (1)$$

- Category Module: Categories of POIs visited show the user's interests.

$$\phi_{ct}(l, c) = arg\ max \prod_{l_i \in L} \prod_{c_j \in C_i} \prod_{c_q \in Q(c_j)} p(c_q|c_j, l_i) \quad (2)$$

- Objective Function

$$\psi_{emb} = \phi_{ch}(l, S_l) + \phi_{ct}(l, c) \quad (3)$$

Model Workflow (CATAPE)

Figure 1 shows the workflow of pre-trained POI embedding from CATAPE to produce top k recommendation list.
CATEPE learns high-dimensional POI embeddings. Then, the learned POI embedding is fed to a recommender model which is able to utilize this information to provide accurate recommendation.

Figure 1 – CATAPE Model Overview

Experiments

- Datasets: Yelp and Gowalla
  - **Yelp:** 357,410 check-ins made by 6,254 users on 21,240 POIs and 507 unique categories.
  - **Gowalla:** 456,988 check-ins made by 10,162 users at 24,250 POIs with 417 categories.
- Model variations:
  - CATAPE-NoCat
  - CATAPE

Results

Table 1 – Performance comparison with baselines in terms of Precision@k and Recall@k for $k \in \{5,10,20\}$ on Gowalla and Yelp. The superscripts † and ‡ denote significant improvements compared to baselines and CATAPE-NoCat, respectively ($p < 0.05$).

Conclusion

We introduced a novel POI embedding model and demonstrated the importance of characteristics of POIs in POI embedding. Our model captures the sequential influence of POIs from check-in sequence of users, as well as, characteristics of POIs using the category information.
